# **Psychometric Report**

## **Extroversion/Introversion Test**

## **Description:**

A 40-item test assessing extroversion/introversion. Low scores indicate extreme introversion; high scores indicate extreme extroversion. The test yields an overall extroversion/introversion score and a personalized interpretation of the results.

## **Reference:**

Jerabek, I. (1997). Extroversion/Introversion Inventory - Revised. Queendom.com

**Sample Size:** 40887

## **Sample Description:**

The sample used in this study was randomly selected from a pool of over 80000 participants. It includes men and women, aged 10 to 80, who took the test on the Queendom.com website.

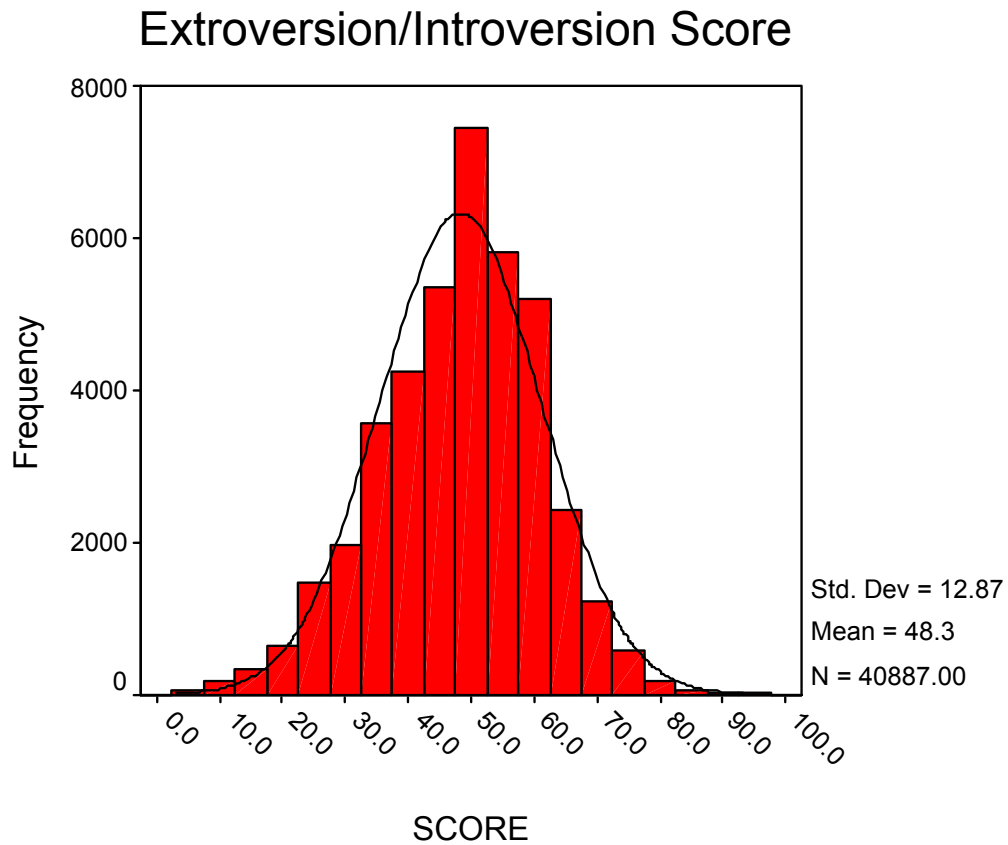

**Number of questions:** 40

## Descriptive Statistics

See Annex 1 for Descriptive statistics

### Distribution for the Extroversion/Introversion Test

The distribution of the scores is shown in red; the normal curve is represented by the black line plotted over it. The scores are displayed on the x-axis. The y-axis corresponds to the number of respondents who fall into the relevant score range.

## Reliability and Internal Consistency

### Score (26 items)

#### Inter-Item Consistency

Cronbach's Coefficient Alpha: 0.8811

#### Split-Half Reliability

Correlation between forms: 0.7557

Spearman-Brown formula: 0.8608

Guttman's formula: 0.8597

# Criterion and Construct Validity

## 1. Relationship between extroversion score and self-esteem:

Question #1: How is your self-esteem?

VALUE="1" > Rock bottom

VALUE="2" > Low

VALUE="3" > Could be better

VALUE="4" > Solid

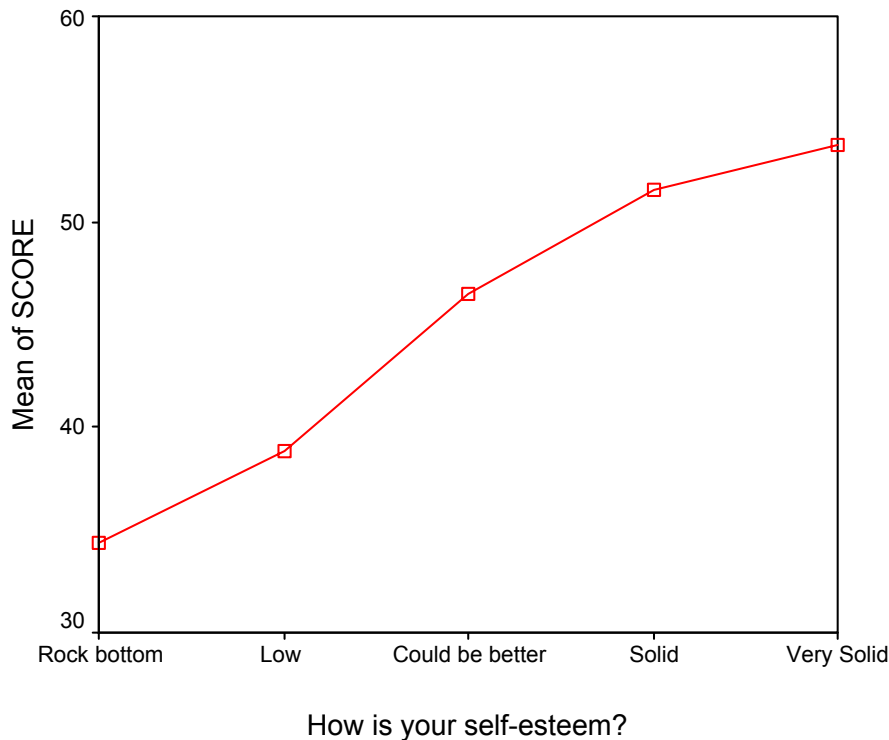

VALUE="5" > Very solid

Significant score differences were found among groups of subjects depending on their level of self-esteem. Subjects who rated themselves the highest on self-esteem had the highest extroversion scores. Subjects who rated themselves the lowest on self-esteem had the lowest extroversion scores. The relationship seems linear – the higher one perceives their self-esteem to be, the higher their extroversion score. The effects are robust. See Annex 2 for a table showing homogeneous subsets.

$F_{(4,25279)} = 937.736$

$p < 0.0001$

### EXTROVERSION SCORE AND SELF-ESTEEM

## 2. Relationship between extroversion score and enjoyment interacting with others:

Question #2: Do you enjoy interacting with other people?

VALUE="1" > Never

VALUE="2" > Not very often

VALUE="3" > Once in a while

VALUE="4" > Sometimes

VALUE="5" > Most of the time

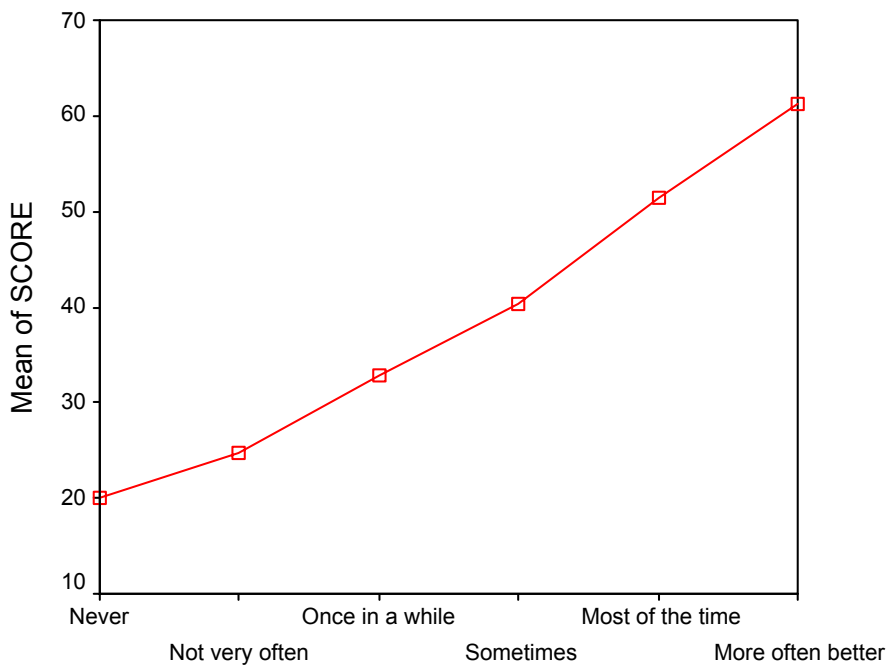

VALUE="6" > The more often the better

Significant score differences were found among groups of subjects depending on their enjoyment interacting with others. Subjects who reported the highest enjoyment interacting with others had the highest extroversion scores. Subjects who reported the lowest enjoyment interacting with others had the lowest extroversion scores. A positive linear correlation was found between extroversion scores and the amount of enjoyment one gets interacting with others. The effects are robust. See Annex 3 for a table showing homogeneous subsets.

$F_{(5,25516)} = 5732.130$

$p < 0.0001$

### EXTROVERSION SCORE AND ENJOYMENT INTERACTING WITH OTHERS:

Do you enjoy interacting with other people?

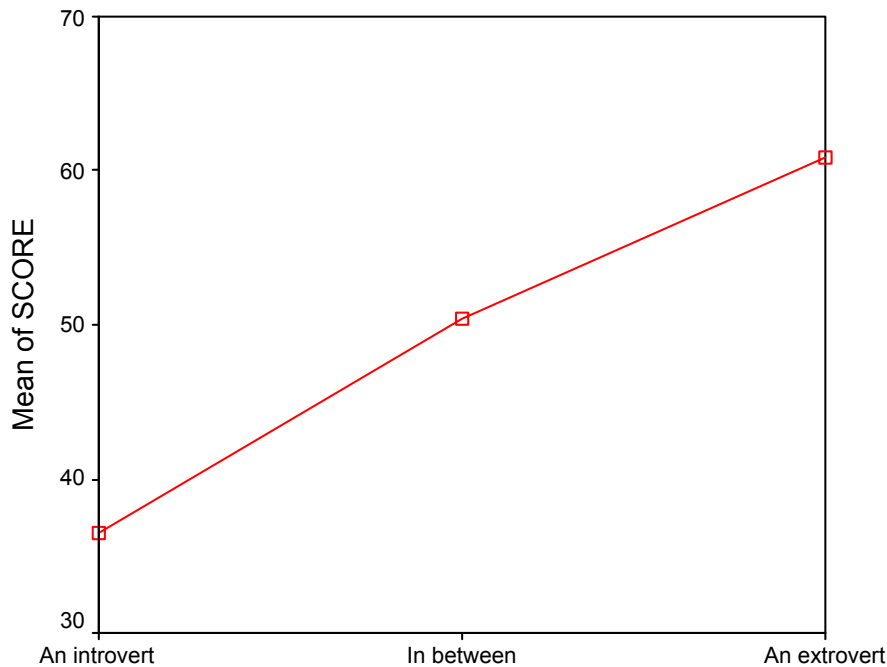

### 3. Relationship between extroversion score and extroversion self-rating:

Question #3: Off the top of your head, would you say you are:  
VALUE="1" > An introvert  
VALUE="2" > Somewhere in between  
VALUE="3" > An extrovert

Significant score differences were found among groups of subjects depending on their self-reported extroversion scores. Subjects who rated themselves as “extroverts” had the highest extroversion scores. Subjects who rated themselves as “introverts” had the lowest extroversion scores. A linear relationship was found between the extroversion score and one’s self rating on extroversion: as one’s perceived extroversion increased so did their extroversion score. The effects are robust. See Annex 4 for a table showing homogeneous subsets.

$F_{(2,249490)} = 10325.315$        $p < 0.0001$

#### EXTROVERSION AND EXTROVERSION SELF-RATING

Off the top of your head, would you say you are:

#### 4. Relationship between extroversion score and extroversion rating by others:

Question #4: Others would say you are:  
VALUE="1" > An introvert  
VALUE="2" > Somewhere in between  
VALUE="3" > An extrovert

Significant score differences were found among groups of subjects depending on their extroversion level reported by others. Subjects who were rated as “extroverts” by others had the highest extroversion scores while subjects who were rated as “introverts” by others had the lowest extroversion scores. A positive linear correlation was found between one’s extroversion score and other people’s ratings of the subjects extroversion level: the higher the extroversion score for a particular subject, the higher other’s perceived the subject extroversion levels to be. The effects are robust. See Annex 5 for a table showing homogeneous subsets.

$F_{(2,24167)} = 5196.421$        $p < 0.0001$

#### EXTROVERSION SCORE AND EXTROVERSION RATED BY OTHERS

Others would say you are:

## 5. Relationship between extroversion score and score on other extroversion tests:

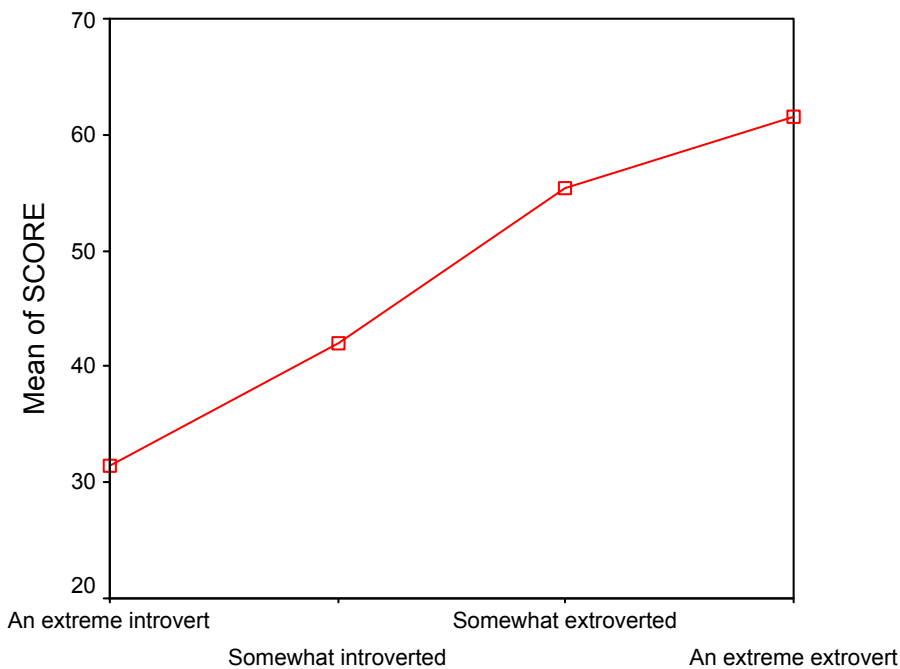

Question #5: Have you taken another introversion/ extroversion test? If so, you were qualified as:

VALUE="1" > An introvert  
VALUE="2" > Somewhere in between  
VALUE="3" > An extrovert

Significant score differences were found among groups of subjects depending on their classification on other extroversion tests. Subjects who were classified as "extreme extroverts" on other extroversion tests had the highest extroversion scores while subjects who were classified as "extreme introverts" had the lowest extroversion scores. A positive relationship was found between one's extroversion score and their result (or classification) on other extroversion tests. The effects are robust. See Annex 6 for a table showing homogeneous subsets.

$F_{(3,7317)} = 1948.152$        $p < 0.0001$

### EXTROVERSION SCORE AND CLASSIFICATION ON OTHER EXTROVERSION TESTS

Have you taken another extroversion test? If so, you were qualified as:

## 6. Relationship between extroversion score and age groups:

Question #6: Age:

VALUE="1" > 10 - 15

VALUE="2" > 16 - 18

VALUE="3" > 19 - 24

VALUE="4" > 25 - 29

VALUE="4" > 30 - 34

VALUE="5" > 35 - 39

VALUE="6" > 40 - 49

VALUE="7" > 50 - 59

VALUE="8" > 60+

Significant score differences were found among various age groups. The relationship seems to be linear – the older one is, the lower the extroversion score, but an increase in extroversion seems to take place once one reaches 50. The effects are robust. See Annex 7 for a table showing homogeneous subsets.

$F_{(8,11210)} = 67.83$        $p < 0.0001$

### EXTROVERSION AND AGE GROUPS

## Gender Differences

### Extroversion score:

- Women scored significantly higher than men on extroversion:  
 $t_{(26161)} = 4.017$        $p < 0.0001$       Mean difference: 0.68

### GROUP STATISTICS

	Gender	N	Mean	Std. Deviation	Std. Error Mean
Score	Women	17520	48.62	12.654	.096
	Men	8643	47.94	13.599	.146

### INDEPENDENT SAMPLES TEST

#### t-test for Equality of Means

	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
						Lower	Upper
Score	4.017	26161	.000	.68	.171	.351	0.019

## ANNEX 2 – Homogeneous Subsets

The following tables present the homogeneous subsets for extroversion score with respect to self-esteem.

### EXTROVERSION SCORE

Tukey HSD

How is your self-esteem?	N	Subset for alpha = .05				
		1	2	3	4	5
Rock bottom	664	34.33				
Low	2277		38.81			
Could be better	9929			46.53		
Solid	9560				51.51	
Very Solid	2854					53.79
Sig.		1.000	1.000	1.000	1.000	1.000

Means for groups in homogeneous subsets are displayed.

a Uses Harmonic Mean Sample Size = 1999.279.

b The group sizes are unequal. The harmonic mean of the group sizes is used. Type I error levels are not guaranteed.

### ANNEX 3 – Homogeneous Subsets

The following table presents the homogeneous subsets for extroversion score with respect to enjoyment interacting with others.

#### EXTROVERSION SCORE

Tukey HSD

		N Subset for alpha = .05					
<b>Do you enjoy interacting with other people?</b>		1	2	3	4	5	6
<b>Never</b>	167	20.02					
<b>Not very often</b>	904		24.82				
<b>Once in awhile</b>	1601			32.76			
<b>Sometimes</b>	6034				40.36		
<b>Most of the time</b>	12223					51.41	
<b>The more often the better</b>	4593						61.15
<b>Sig.</b>		1.000	1.000	1.000	1.000	1.000	1.000

Means for groups in homogeneous subsets are displayed.

a Uses Harmonic Mean Sample Size = 733.130.

b The group sizes are unequal. The harmonic mean of the group sizes is used. Type I error levels are not guaranteed.

## ANNEX 4 – Homogeneous Subsets

The following tables present the homogeneous subsets for extroversion score with respect to self-reported extroversion.

### EXTROVERSION SCORE

Tukey HSD

		NSubset for alpha =		
		.05		
<b>Off the top of your head, would you say you are:</b>		1	2	3
<b>An introvert</b>	7704	36.44		
<b>Somewhere in between</b>	12384		50.46	
<b>An extrovert</b>	4864			60.82
<b>Sig.</b>		1.000	1.000	1.000

Means for groups in homogeneous subsets are displayed.

a Uses Harmonic Mean Sample Size = 7209.040.

b The group sizes are unequal. The harmonic mean of the group sizes is used. Type I error levels are not guaranteed.

## ANNEX 5 – Homogeneous Subsets

The following tables present the homogeneous subsets for extroversion score with respect to reported extroversion levels by others.

### EXTROVERSION SCORE

Tukey HSD

	N	Subset for alpha = .05		
<b>Others would say you are:</b>		1	2	3
<b>An introvert</b>	7144	38.16		
<b>Somewhere in between</b>	8288		48.50	
<b>An extrovert</b>	8738			55.90
<b>Sig.</b>		1.000	1.000	1.000

Means for groups in homogeneous subsets are displayed.

a Uses Harmonic Mean Sample Size = 7998.365.

b The group sizes are unequal. The harmonic mean of the group sizes is used. Type I error levels are not guaranteed.

## ANNEX 6 – Homogeneous Subsets

The following tables present the homogeneous subsets for extroversion score with respect to results on other tests.

### EXTROVERSION SCORE

Tukey HSD

	N	Subset for alpha = .05			
		1	2	3	4
<b>Have you taken another introversion/extroversion test? If so, you were qualified as:</b>					
<b>An extreme introvert</b>	992	31.44			
<b>Somewhat introverted</b>	3184		42.06		
<b>Somewhat extroverted</b>	2327			55.35	
<b>An extreme extrovert</b>	818				61.47
<b>Sig.</b>		1.000	1.000	1.000	1.000

Means for groups in homogeneous subsets are displayed.

a Uses Harmonic Mean Sample Size = 1344.824.

b The group sizes are unequal. The harmonic mean of the group sizes is used. Type I error levels are not guaranteed.

## ANNEX 7 – Homogeneous Subsets

The following tables present the homogeneous subsets for extroversion score with respect to age group.

### EXTROVERSION SCORE

Tukey HSD

Age Groups	N	Subset for alpha =		
		.05		
		1	2	3
40 – 49 yrs old	1814	45.55		
35 – 39 yrs old	1392	45.97		
50 – 59 yrs old	656	46.24	46.24	
30 – 34 yrs old	2069	46.38	46.38	
60 yrs+	163	46.80	46.80	
25 – 29 yrs old	3216	47.05	47.05	
19 – 24 yrs old	8058		48.12	
16 – 18 yrs old	6519			50.30
10 – 15 yrs old	2381			51.62
<b>Sig.</b>		.264	.060	.449

Means for groups in homogeneous subsets are displayed.

a Uses Harmonic Mean Sample Size = 863.659.

b The group sizes are unequal. The harmonic mean of the group sizes is used. Type I error levels are not guaranteed.
